

# KUBERNETES 101

## DEPLOYING YOUR FIRST CLOUD NATIVE APPLICATION

CATALIN JORA | CONTAINER SOLUTIONS | @JOCATALIN

ATMOSPHERE CONF KRAKOW | 16 MAY 2017

WHO AM I

Catalin Jora (Engineer @ Container Solutions)  
@jocatalin

# KUBERNETES 101

Why: cloud native applications

What: the building blocks

How: deploying application (demo)

# WHY KUBERNETES

defining cloud native applications

# SOFTWARE CAPABILITIES WISH LIST 2017

Speed

Scale

Costs

# SPEED OF RELEASE

Release cycle of software will only accelerate, will (probably) never slow down.

SCALE

Software should be able to grow with user/business demand

# COSTS

Reduce infrastructure costs by moving from pay in advance to pay per use

# CLOUD NATIVE SYSTEMS

distributed systems environments  
capable of scaling to tens of  
thousands of self healing multi-tenant  
nodes | [cncf](#)

# CLOUD NATIVE APPLICATIONS

Packed in containers

Dynamically managed

Micro-service oriented

# WHAT IS KUBERNETES

Kubernetes is a production-grade, open-source platform that orchestrates the placement (scheduling) and execution of application containers within and across computer clusters.

# KUBERNETES CAN RUN ON

laptop

public cloud

on-premises

# HOW TO RUN KUBERNETES

vanilla (you will do the maintenance)

managed (as a service)

# KUBERNETES ARCHITECTURE

# KUBERNETES ARCHITECTURE

## MASTER

etcd, API server, controller manager, scheduler,  
kubelet

## NODES

kubelet, docker

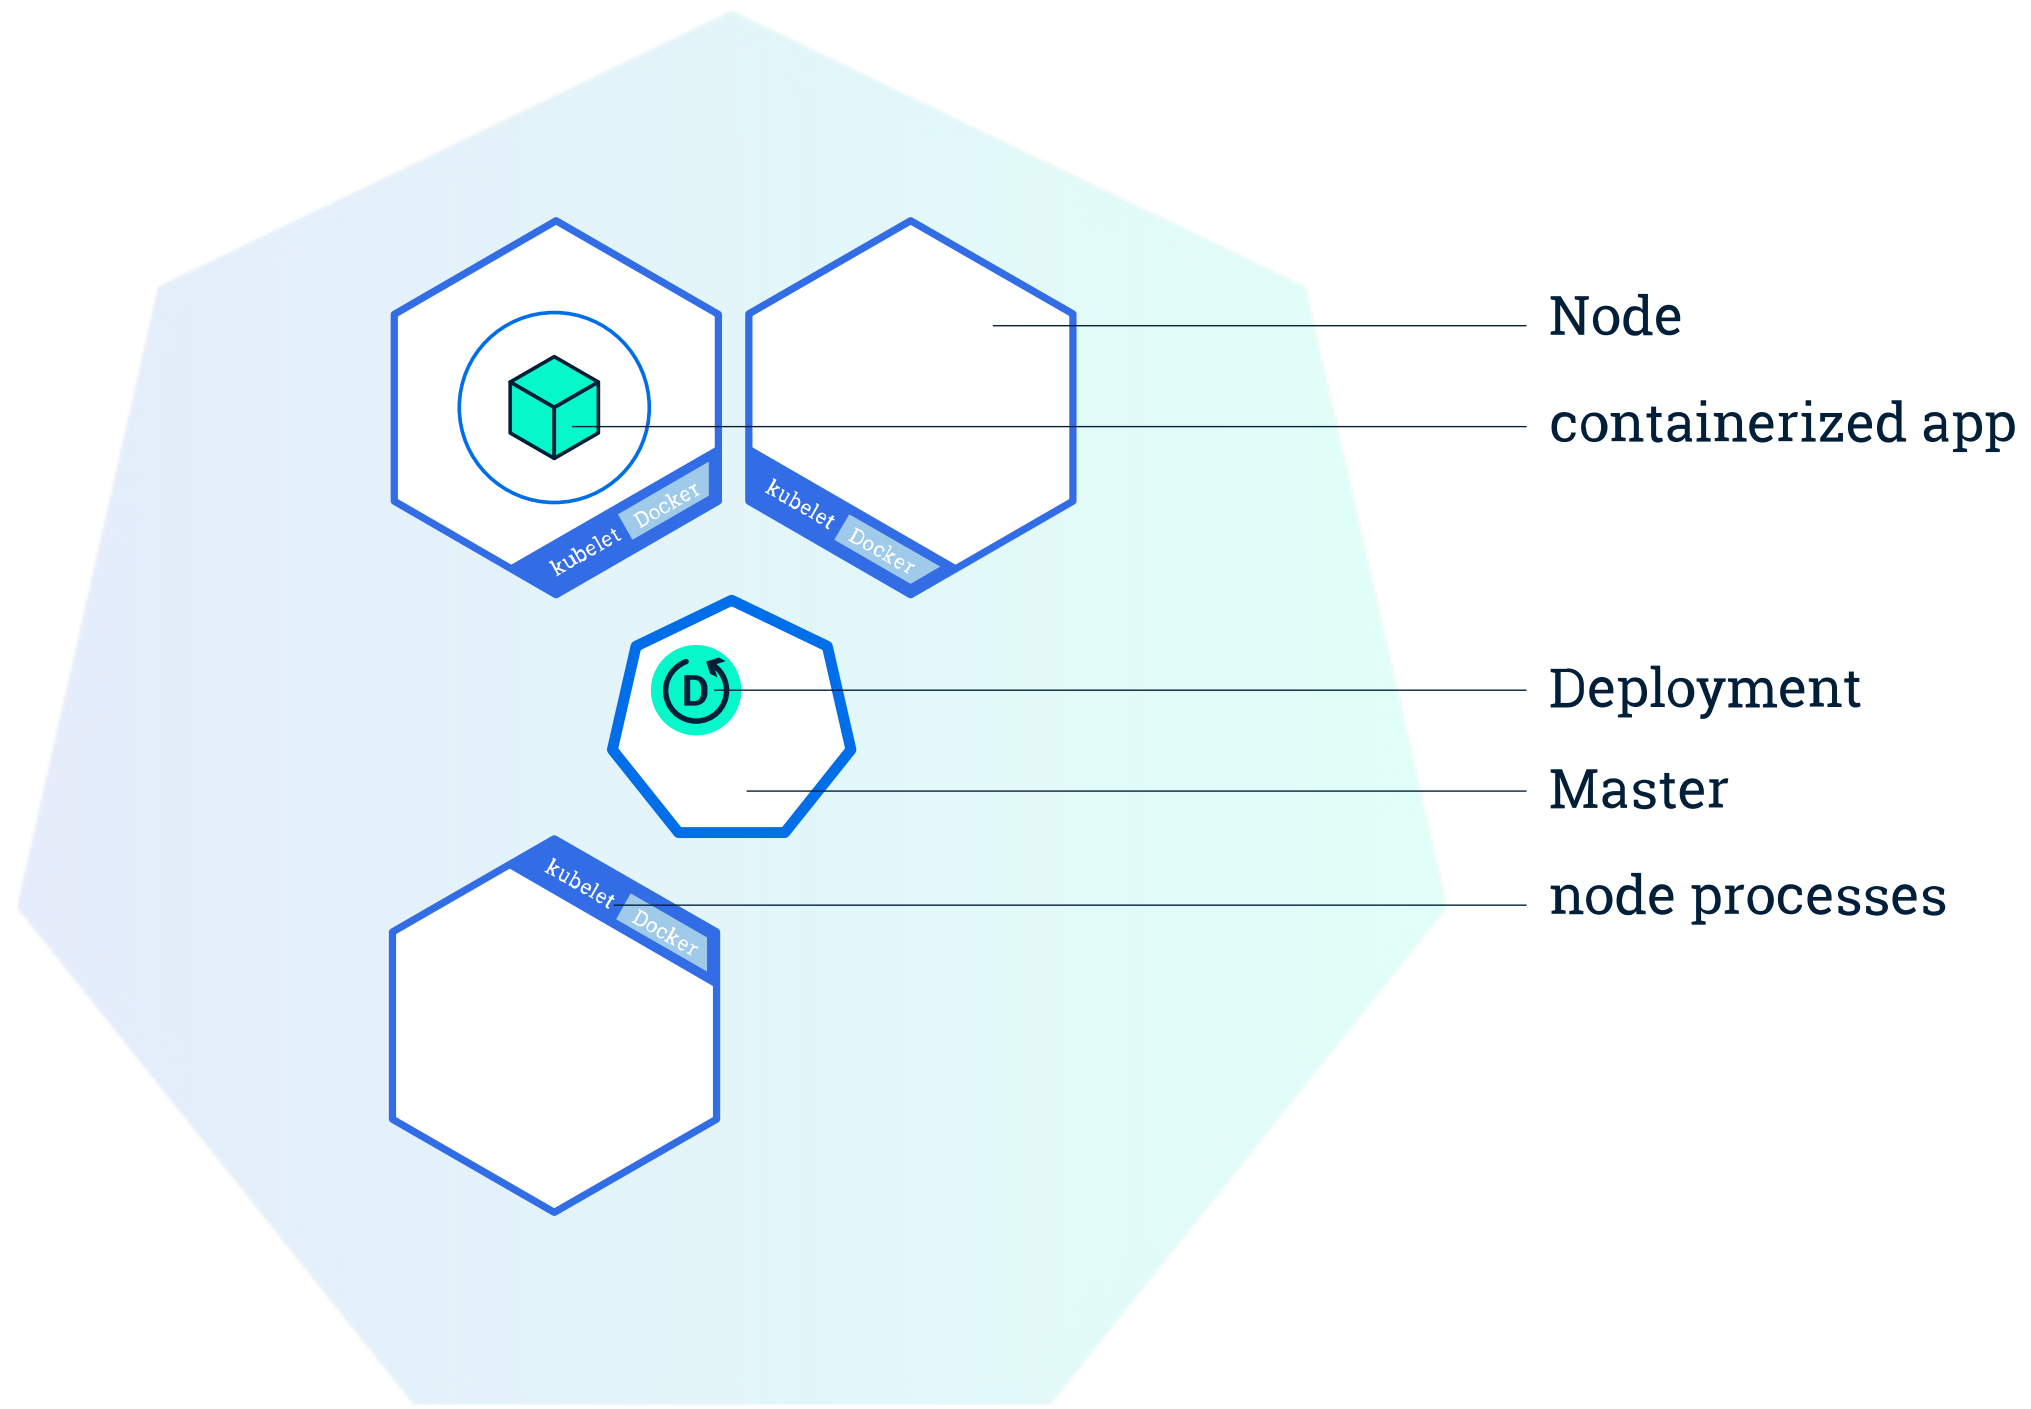

# KUBERNETES DEPLOYMENT

- responsible for creating and updating the instances of your applications
- provide a self-healing mechanism

# KUBERNETES DEPLOYMENT

# KUBERNETES POD

- a group of one or more containers (e.g. Docker)
- shared storage & unique cluster level IP
- info about container image, ports, resources (CPU, RAM)

# KUBERNETES POD

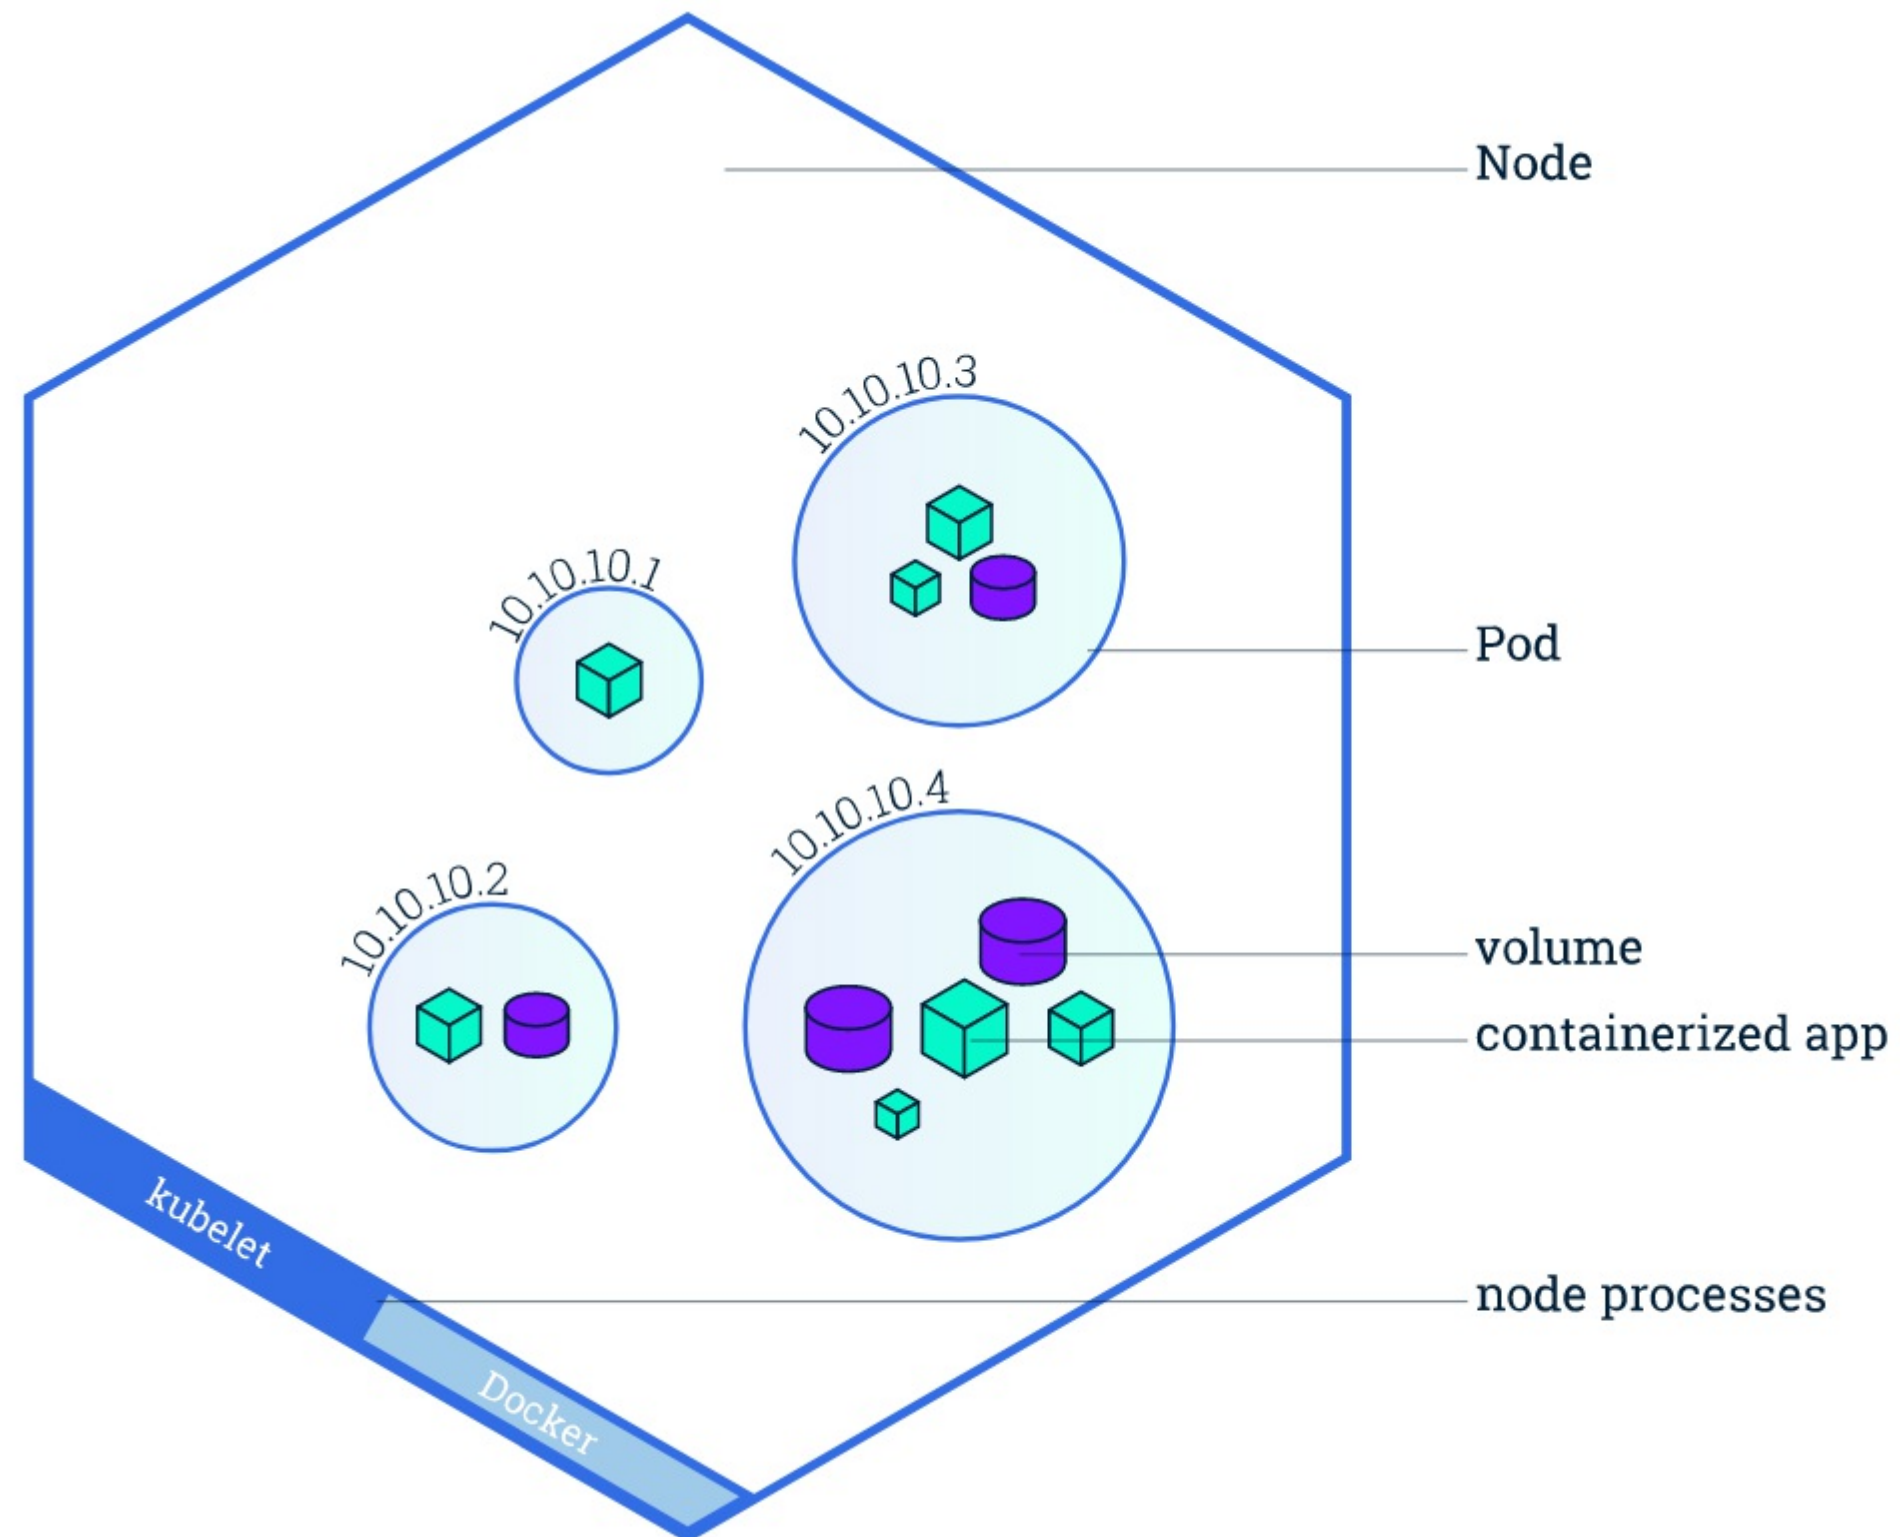

- are mortal
- are the atomic unit on Kubernetes
- deployments are creating pods with containers inside them

# KUBERNETES POD

# KUBERNETES NODE

# KUBERNETES SERVICE

-

ABSTRACTION LAYER WHICH DEFINES A LOGICAL SET OF PODS

- enables external traffic exposure
- load balancing
- service discovery for pods

## KUBERNETES LABEL

- key/value pairs attached to objects (E.g Pods)
- help organizing objects
- can be changed anytime

# SCALLING APPLICATIONS

-

## CHANGING THE NUMBER OF REPLICAS IN A DEPLOYMENT

- traffic is sent only to up & running pods
- new pods are created on nodes with available resources
- running multiple pod replicas allow zero-downtime updates

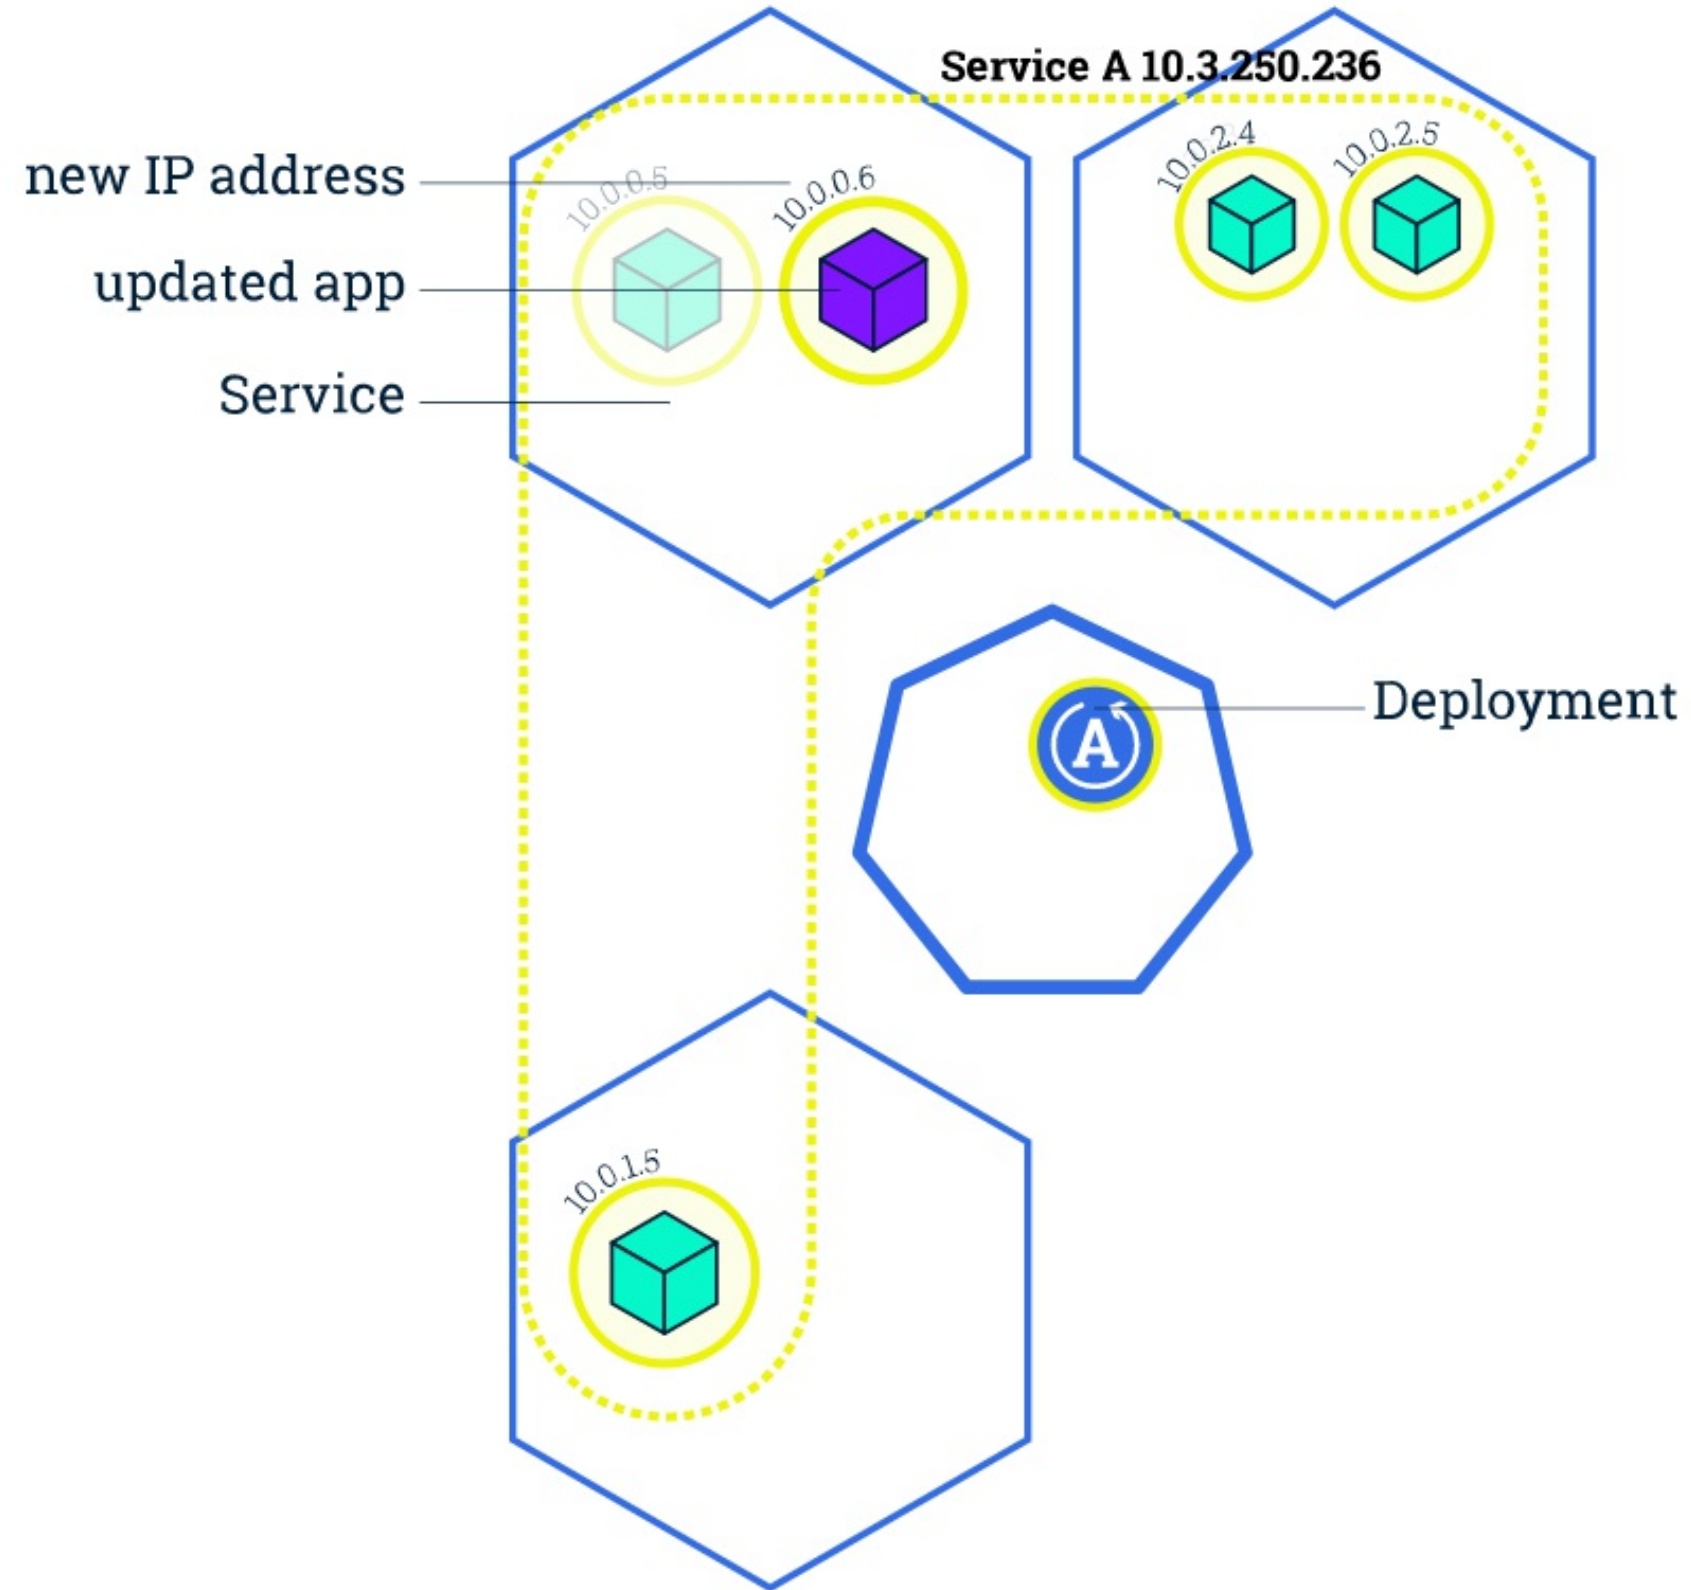

# ROLLING UPDATES

-

## INCREMENTAL PODS UPDATE FOR DEPLOYMENTS

- CI/CD with zero downtime

# HOW TO DEPLOY ON KUBERNETES (DEMO)

# LEARN KUBERNETES

- Beginner: <https://katacoda.com/courses/kubernetes>
- Advanced:  
<https://github.com/kelseyhightower/kubernetes-the-hard-way>

# TAKE AWAYS KUBERNETES

- Works only with containers
- Scales your app in line with the demand
- Make intelligent use of available resources
- Deploys apps with zero-downtime

THANKS!
